Category: Biological and Ecological Sciences

Age Group: Junior (Grade 7-9) Senior (Grade 10-12)

ABSTRACT:

Knowing the different types of ecosystem and their definitions along with its facts, can bring lots of benefits to us since it helps improve the understanding of people when it comes to Ecology, these topics can also help us learn more about our planet, as well as getting us ready for the future. How? You may ask, we can always come up with different solutions to help thrive Mother Earth back to its normal stage since the more we learn about our planet, the more our general knowledge can increase, and the more ideas and solutions will come to our head so we can lend a hand to help our society.

Coming up with this project is not very easy, because we have to work with each other online and our internet connections aren't always fast. And we can't do some ideas we have in mind, since we live separately. Although there are many difficulties, we manage to finish this project successfully. And this is how we manage to do it,

First, we pick a category to work on. Then, we researched on our topic that we picked which is based on Ecology. After, we gathered all the information that we researched and started working on the Google Slide. Later, we recorded our parts individually. Lastly, we edit our video and put it into one.

We would say that our result is better than we expected but we're sure that we could do better if we could meet up. Although there are lots of situations where we can't keep things together, we're still very proud of our result, especially about all the things we learnt while coming up with this project. Here are some of the things we learnt,

- we learnt that there are many types of Ecosystem where some are more complex than the others.
- we also learnt about doing a partner project online instead of meeting up like we usually do and this is one of the projects we've done without a teacher's assistance.

In conclusion, knowing about The Earth is very important since it's our only planet. If we, humans, keep on harming The Earth (Ex: destroying different ecosystems) we won't be able to fix it anytime sooner or later, especially when no one cares about their own environment including the fact that most people have less understanding when it comes to Ecology.
